

QUICK START

Open the tool through the menu command: Assets/Asset Inventory

Index

- In order to search, an index needs to be created
- Initial indexing will take probably hours, do from a new empty project on the latest LTS Unity version for maximum performance
- Interrupt indexing at any time, it will continue where it left off
- Index will be shared between any project which has the tool installed
- Click *Settings/Run Actions* regularly, especially after a purchase, to update the index and update metadata information
- For downloaded packages from Synty and other sources, add these folders as *Additional Folders* under *Settings*

Usage

- The search field is really powerful, use e.g. "book -shelf" to search for books but not book shelves
- Use the search scope toolbar to choose Index, Project, or All.
- Everything is indexed but multiple file types (e.g. scripts) are initially hidden in the search results, adjust view *Search Settings*
- Use Hide Content for large packages; Hidden Files reveals results.
- Bulk selection and actions are possible in *Search* and *Package* view
- Tag frequently used packages for bulk import in new projects.
- Custom actions can be great time-savers
- Assets can be dragged directly into the scene after import
- Use Where Used to find project references.
- AI assistants can use the optional Unity MCP integration.
- Use the eye icon in the upper toolbar to show or hide advanced features
